

METHOD AND APPARATUS FOR CONVERTING DATA BETWEEN TWO DISSIMILAR SYSTEMS

ABSTRACT OF THE DISCLOSURE

[0230] Method and apparatus for converting data between two dissimilar systems. A method for transferring information between first and second systems with dissimilar first and second database structures, respectively, is provided. The method includes the step of first extracting data from the first system and then routing the extracted data from the first system to a first conversion server. At the first conversion server, the data is converted from a format compatible with the first database structure to an intermediate format. The data in the intermediate format is then routed to a second conversion server. At the second conversion server, the data is converted from the intermediate format to a format compatible with the second database structure. The data converted at the second conversion server is then stored in the second system.
